

HOSTED SERVICES

In today's evolving market, providing secure, reliable data is crucial to your business success. MortgageFlex Systems can control your escalating IT expenses quickly and easily by eliminating in-house resource drains. Our Hosting Services helps you achieve not only your fiscal goals but your business requirements, while maintaining the quality and security demanded by the financial community.

Advantages :

- **Trained IT Staff**– Many lenders do not have properly trained technical staff or if they do, they are stretched thin and are unable to focus on specific system support. In a hosted solution, support and maintenance are included in the service fee, which eliminates the need to train or hire a full-time employee. \$
- **Less Expensive** – Charges for system usage are typically accrued on a per user or per loan basis resulting in lower rates than if deployed locally. \$
- **Cost Containment** - When you utilize a hosting service, you pay for the service, not the software, which means that upgrades are included at no extra charge. \$
- **Quality Control** - Change is a constant in the lending business and that equates to database changes, compliance updates, patches, and version releases. Our staff has the expertise to evaluate each new update in a test environment, ensure that it is ready for use, then modify the production system at an appropriate down time. \$
- **Data Backup** - Full tape backup with off-site storage comes standard. Together with backup power prevents local power outages from obliterating months of data. \$
- **No Hardware Overhead** – A hosted solution requires no capital outlay for hardware, eliminating the need for servers and the requisite climate controlled areas, external security features and the associated reoccurring energy fees. \$
- **Remote Access** - While it may be obvious that all access would be remote, the commonly overlooked advantage is that if using an in-house solution then additional access would have to be provided for remote employees, requiring complex security design. \$
- **Security** - One of the primary advantages of a hosted environment is knowing your data will be secure. Realizing that our joint success depends on this, we have bio-scan monitors, a secure network operations center and 24/7 network monitoring and tracking in a secure premise. \$
